Calculating the state to state GRAPE on Ordi2. In pulsefinder folder. paramsfile is 'twqubit_subS2S.m', and the output file is 'twqubit_7zto12z'.

The GRAPE is to evolve ZZZZZZZIIIII to ZZZZZZZZZZZZ. As the couplings between nearest-neighbored C and H are about 150Hz. I set the GRAPE

```
% Number of timesteps
params.plength = 400;

% Length of each time step
params.timestep = 10e-6;

params.subsystem{1} = [1 2 3 9 10 11];
params.subsystem{2} = [4 5 6 7 8 12];
params.subsys_weight = [6 6];

% Input and goal states for state to state
params.rhoin = mkstate('+1ZZZZZZZIIIII',1);
params.rhogoal = mkstate('+1ZZZZZZZZZZZZ',1);

% Allow Zfreedom or not
params.Zfreedomflag = 1;
```

The fidelity keeps 0 all the time. Guess the reason is 'Zfreedom'. Set 'params.Zfreedomflag = 0;'. However, still 0.

Annie said maybe due to the length. Her SWAP gate requires 8ms, so I changed 'params.plength = 800;'. But for with or without Zfreedom, fidelity is still 0.

Check if some of my GRAPE settings are wrong. try to repeat Annie's SWAP gate calculation.

```
% Number of timesteps
params.plength = 800;

% Length of each time step
params.timestep = 10e-6;

params.subsystem{1} = [1 2 3 9 10 11];
params.subsystem{2} = [4 5 6 7 8 12];
params.subsys_weight = [6 6];

% Input and goal states for state to state
params.rhoin = mkstate('+1IIIIIIIZIIII+1IIIIIIIIZIII+1IIIIIIIIIZII+1IIIIIIIIIIZI
    +1IIIIIIIIIIIZ',1);
params.rhogoal = mkstate('+1IIIIIIIZIIII+1IIIIIIIIZIII+1IIIIIIIIIZII+1
    IIIIIIIIIZI+1IIIIIIIZIIIIZ',1);

% Allow Zfreedom or not
params.Zfreedomflag = 0;
```

The outputfile is 'twqubit_SWAPC7H5'. And the fidelity is already over 98%. Then I changed 'params.Zfreedomflag = 1;', and the fidelity is over 95% after 30 iterations. Much slower than the no Zfreedom case. Maybe due to different initial guesses.

Generate all $\pi/2$ and π pulses for the 7 Carbons, with the Calibration = 25KHz. $\pi/2$ pulses are 1ms length and 100 steps, and π pulses are 2ms length and 200 steps. Generating Code in 'twqubit_shape.m'

```
for ii = 1:7
loadfile = ['twqubit_C', num2str(ii), '180', '.mat'];
eval(['load ', loadfile]);
filename1 = ['twqubit_C', num2str(ii), '180_C_25000.txt'];
filename2 = ['twqubit_C', num2str(ii), '180_H_25000.txt'];
make_bruker_shape(pulses{1}, 25000, filename1,1);
make_bruker_shape(pulses{1}, 25000, filename2,2);
end
```

The pulses are saved in Ordi2 '\pulsefinder\12 Qubit\' with the names such as 'twqubit_C590_C_25000.txt'.

I checked all the fidelities of the $\pi/2$ pulses in the folder '\pulseexam_12qubit\C_rotations\check_grape.m'. The code is

```
load Para.mat
load twpauliX_full.mat
load twpauliY_full.mat

%% Check all 90 rotations
%% Parameters for the GRAPE pulse
for spin_number = 1:7
Name1 = ['twqubit_C', num2str(spin_number), '90_C_25000.txt'];
